About Yostructor

Yostructor is a new business which connects Approved Yoga Instructors (AYIs) with yoga learners.

We will offer a way to reach more learners with reasonable cost for instructor, we also offer yoga learners an easy way to find approved yoga instructor (AYI) nearby.

We are currently have a website for the stated purposes.

Project Proposal

Instructors can register classes on our application to be displayed and selected by learners. Learners can use our current website to search and register for a yoga class.

Project Scope

We are looking for the creation of an application which will allow AYIs register and sell slots in their yoga classes.

It is expected to include:

- iOS and Android versions of the app.
- Sign-in and registration pages with a password reset function.
- A “My Account” section for the AYIs to be able to make changes (if possible) to their contact/bank details etc and view their class current status.
- See their level in the Yostructor and progress towards the next level.
- The ability to provide reference code to learners

- Manage classes’ information and availability
- An information page/section which will provide information on the application including FAQs. Our data protection policy and Ts and Cs.
- A link to our Facebook group and the possibility for other social media.
- Separate buttons for the AYI which would allow them to call or email us.

The project is to complete an app with the above functionality to make the use of the Yostructor more efficient for AYIs, less wasteful and simpler so that it is more attractive for AYIs to use on the go.

I expect that this may cause an increase in the number of users on our service.

1. Elicit requirements & Write BRD

Upon receiving the project proposal, I conducted thorough research and utilized Google Sheet to collaborate with stakeholders and clarify their requirements.

Subsequently, I drafted a Business Requirements Document (BRD) based on their feedback and sent it back for their confirmation to ensure alignment on the features to be implemented in this phase

1.1. Elicit Requirements (See details [here](#))

Below is part of the Question & Answers I made during the course to gather requirements from my customer

No.	Related points in proposal	Question	Answer
Ex	We are looking for the creation of an application which will allow AYIs register and sell slots in their yoga classes	Will this app be used by only instructors? Will earners have accessibility to this app?	This app only provides accessibility for instructors at this current stage
	iOS and Android versions of the app	What is the expected user base scale at the moment? What is the expected user base scale in the future? Will this app allow users to access the camera function?	1&2: I think this part requires a technical meeting between your team and my team to agree on this information 3. Yes
	Sign-in and registration pages with a password reset function	What are the expected sign-in methods for users? - Using Yostructor account + Creating Yostructor account using personal email - Using third-party linked account: + Gmail + Apple ID + Facebook	- Using Yostructor account: 1. Phone number 2. Password

1.2. Write BRD (See details [here](#))

Below is part of the BRD I wrote during the course to conduct business requirements for the project

1. Current business problem:

Yostructor offers a way to reach more learners with reasonable cost for Approved Yoga Instructor (AYIs). They already have a website and now seek an app with similar purposes.

2. The proposed solution:

The Yostructor app allows instructors to register classes. These classes are displayed; learners can select and register classes using the current website.

3. System(s) impacted:

N/A

4. Assumptions/Dependencies:

N/A

5. Business requirements:

5.1 Digital Profile management

5.1.1 Ability for the user to register using phone number

5.1.2 Ability for the user to log in using phone number

5.1.3 Ability for the user to change password

5.1.4 Ability for the user to retrieve password

2. Workshop for Register, Sign-in, and Create New Class (See details [here](#))

To clarify the requirements for creating the mentioned functionalities, I scheduled meetings with stakeholders.

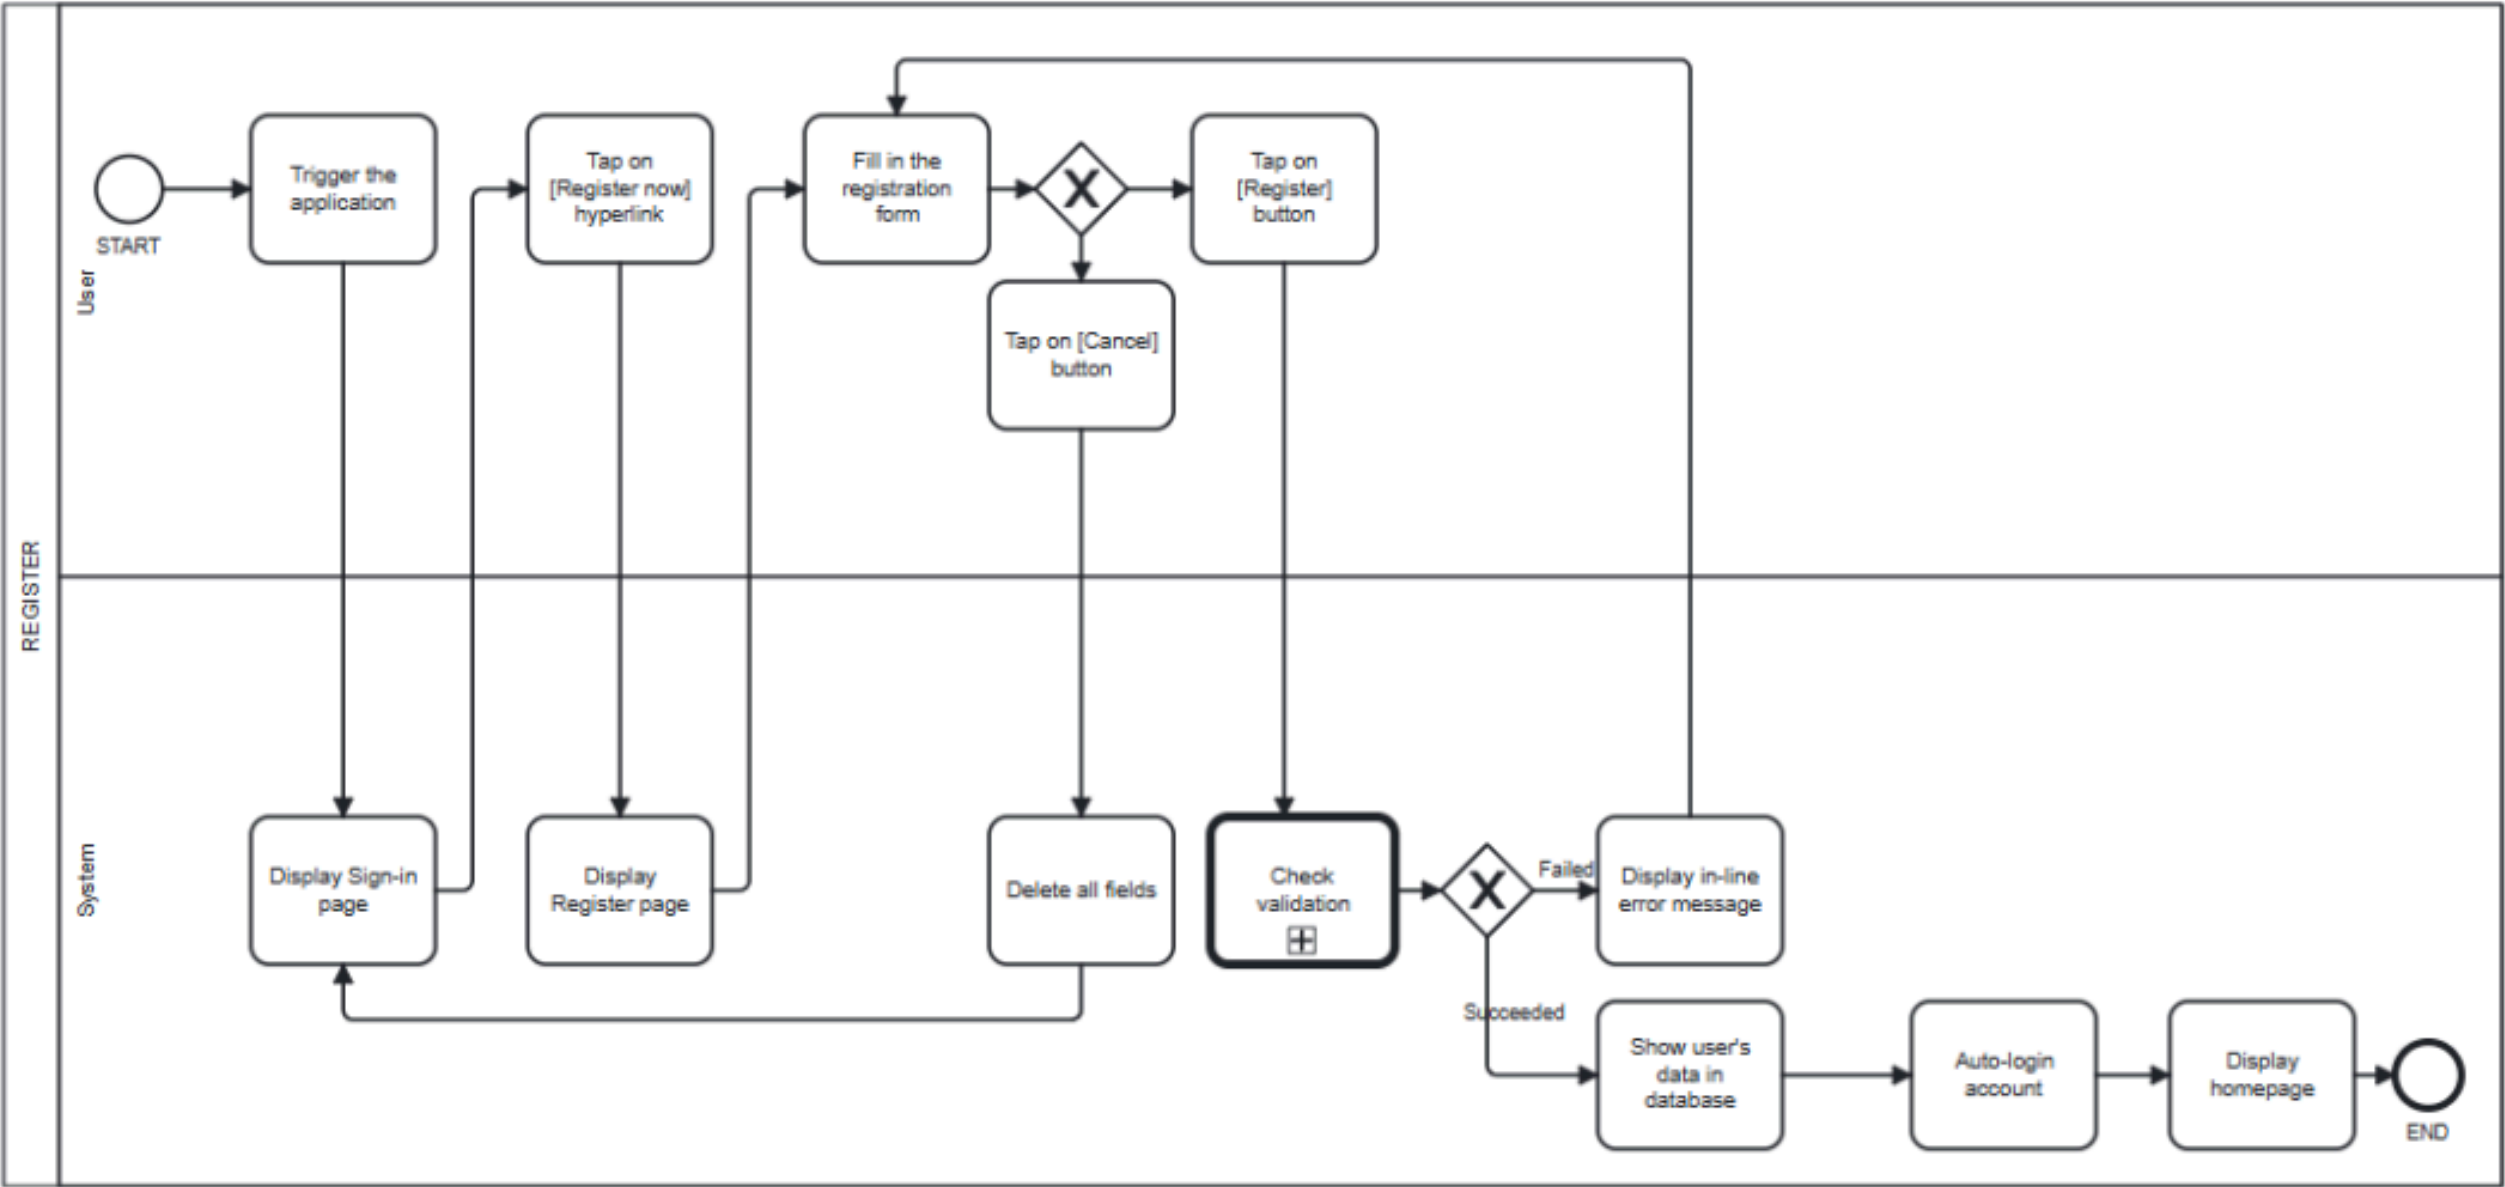

The purpose of this workshop is to clarify the flow of registering, signing in, and creating new classes functions. From there, I can draw accurate BPMN diagrams. In addition, I need to completely collect the requirements for field length, field type of information fields as well as check validation and include in-line error messages for the GUI

3. BPMN

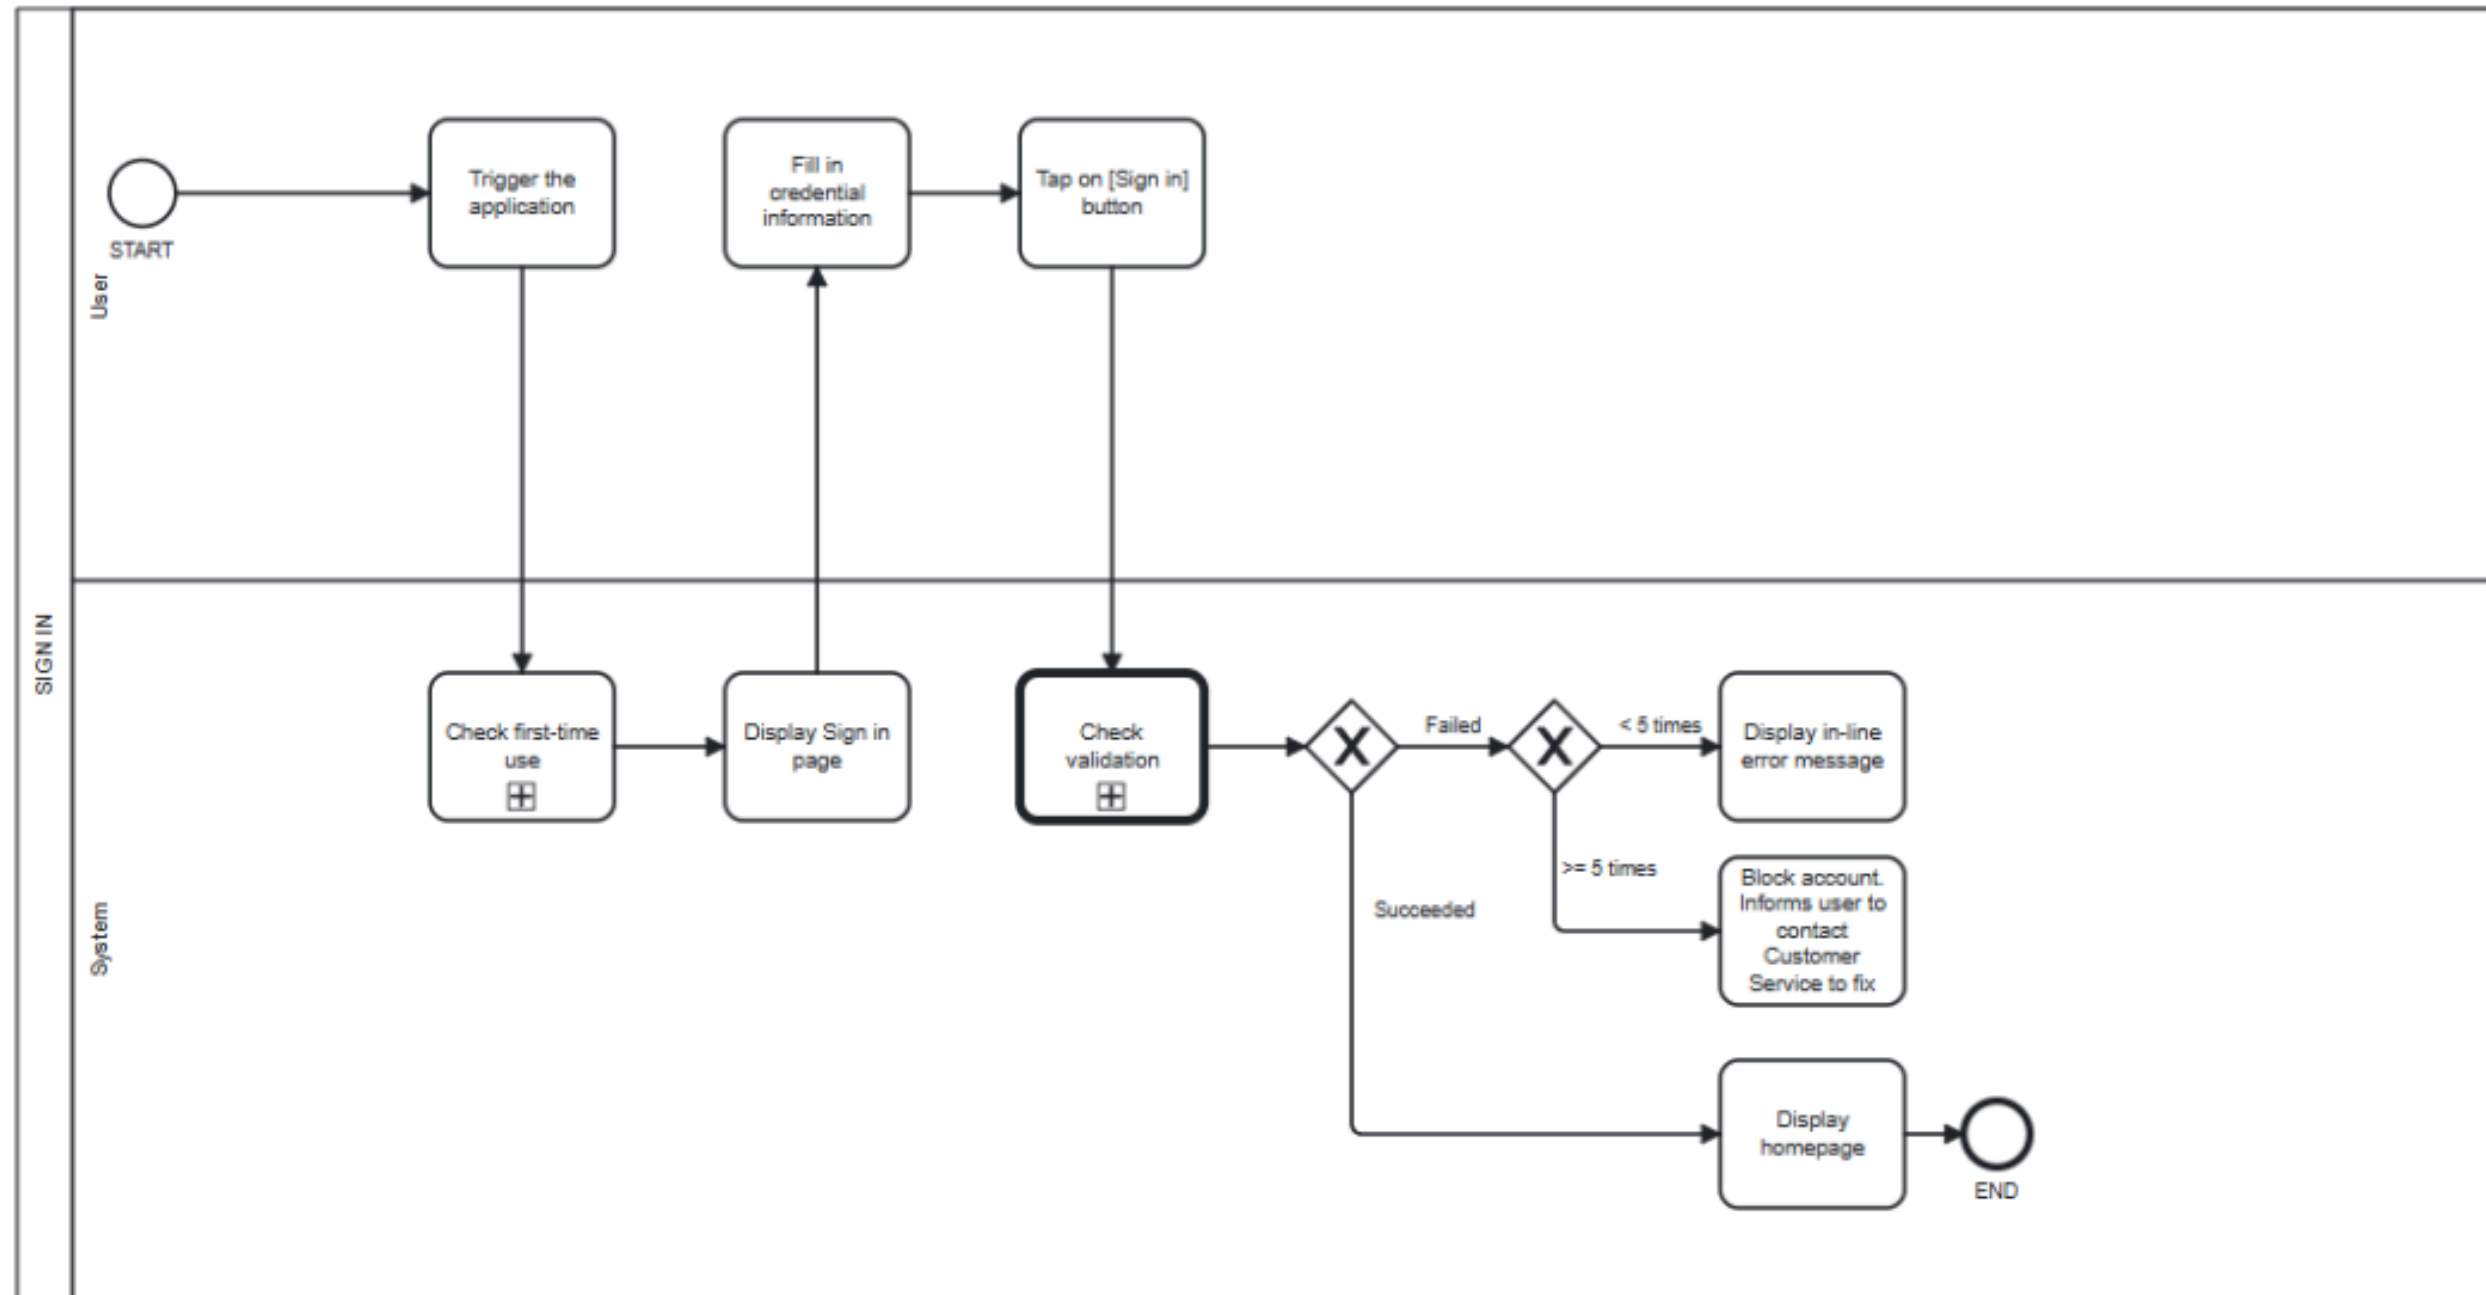

To illustrate the process flow after the stakeholder requirements workshop, I created different BPMN diagrams using bpmn.io

BPMN diagrams are crucial for Business Analysts as they offer a visual representation of business processes, aiding in identification of processes, inefficiencies, mutual interaction, thus supporting the development team.

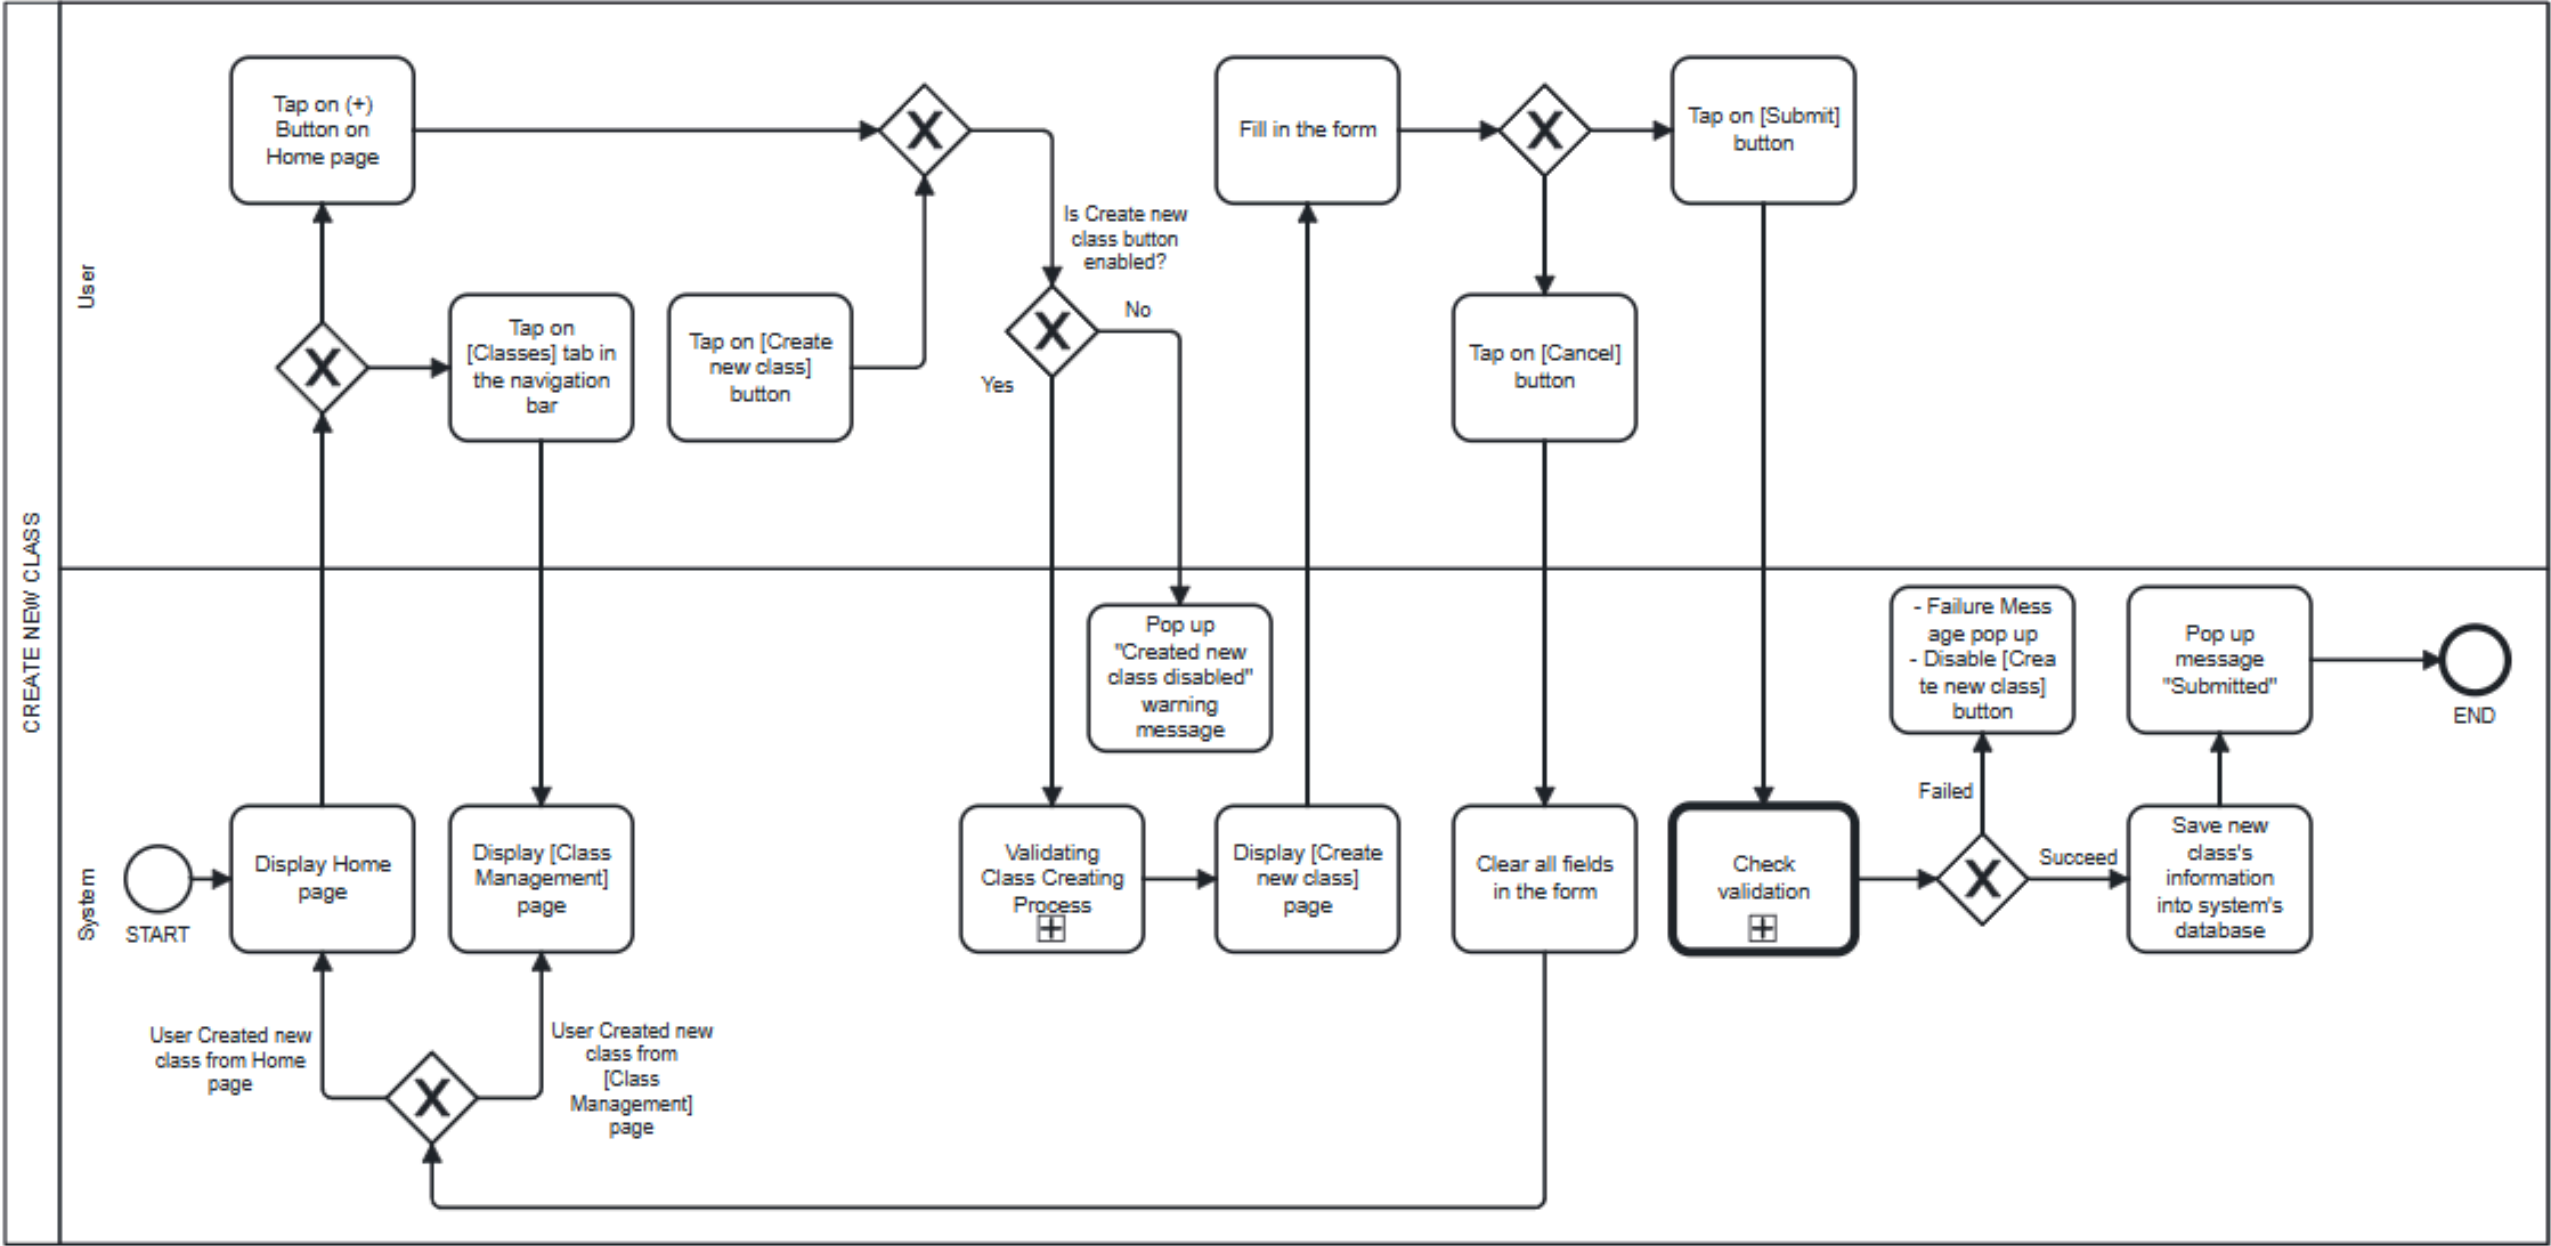

3.1. BPMN - Register

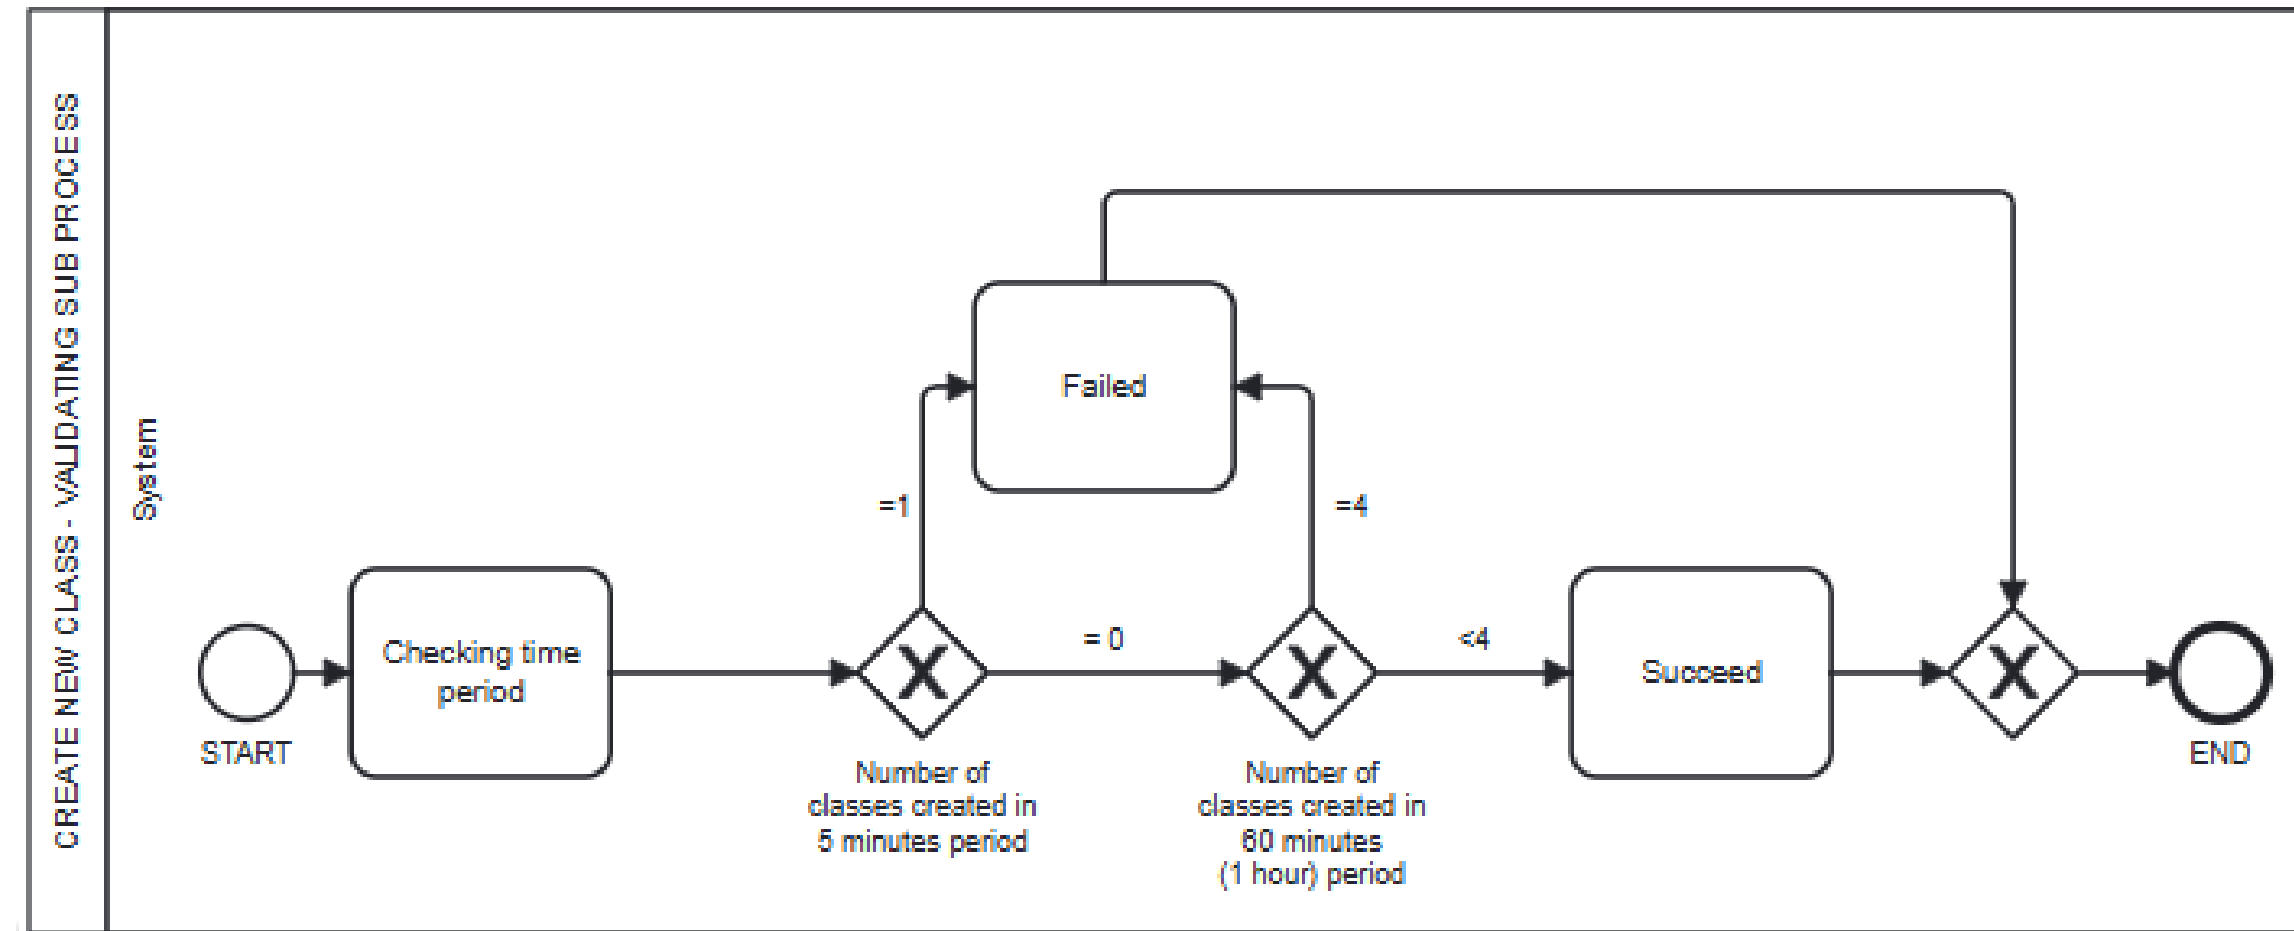

3.2. BPMN - Sign in

3.3. BPMN - Create New Class

3.3. BPMN - Create New Class

4. User Story

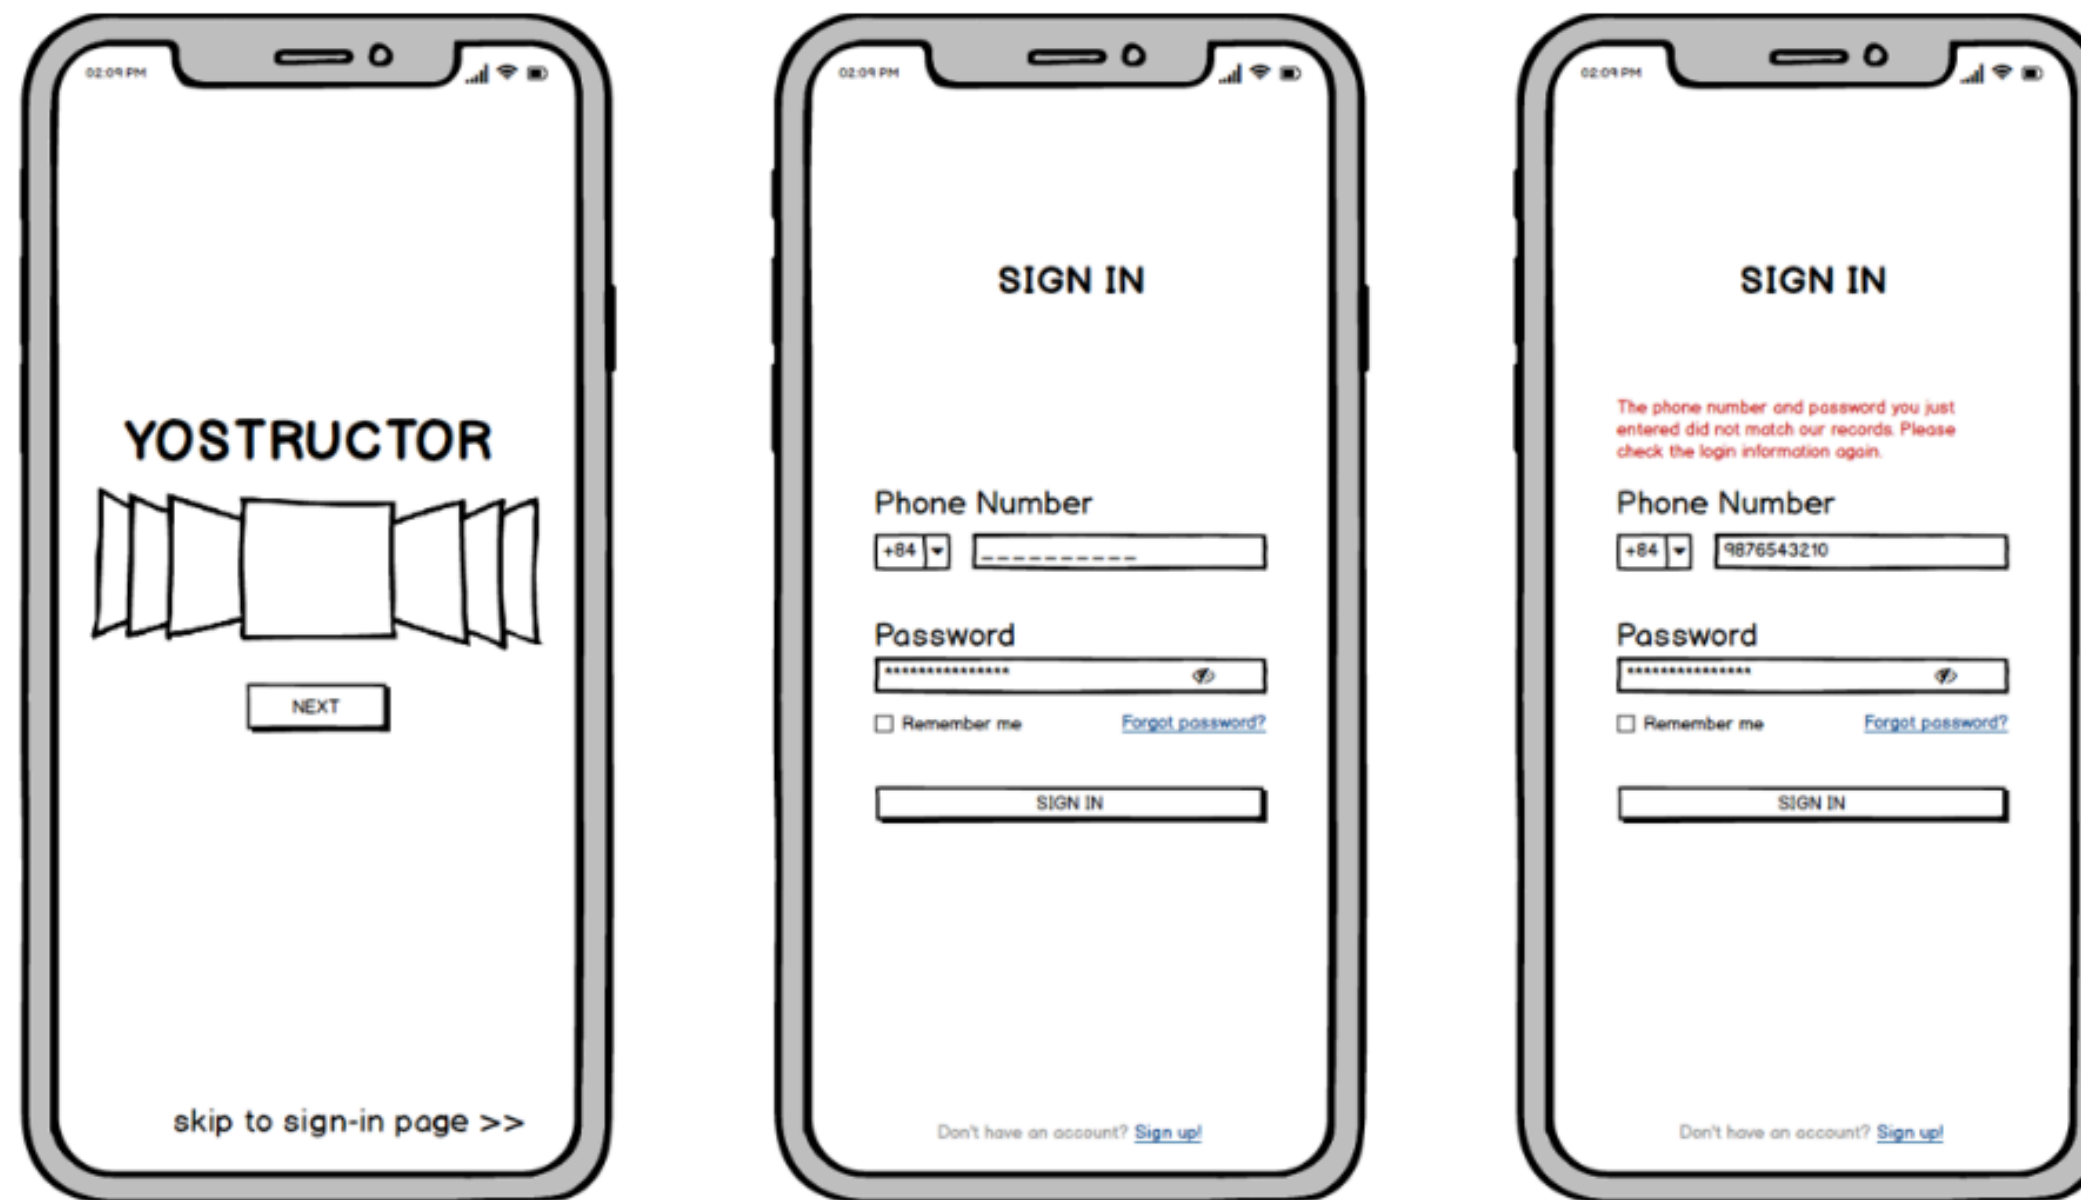

User story include the following parts:

1. Acceptance criteria
2. Authorized user
3. Entry point
4. Exit point
5. Process flow
6. Fields and Validations and Verifications

Please click [here](#) to see detailed user stories of 3 functions: Register, Sign in, Create new class

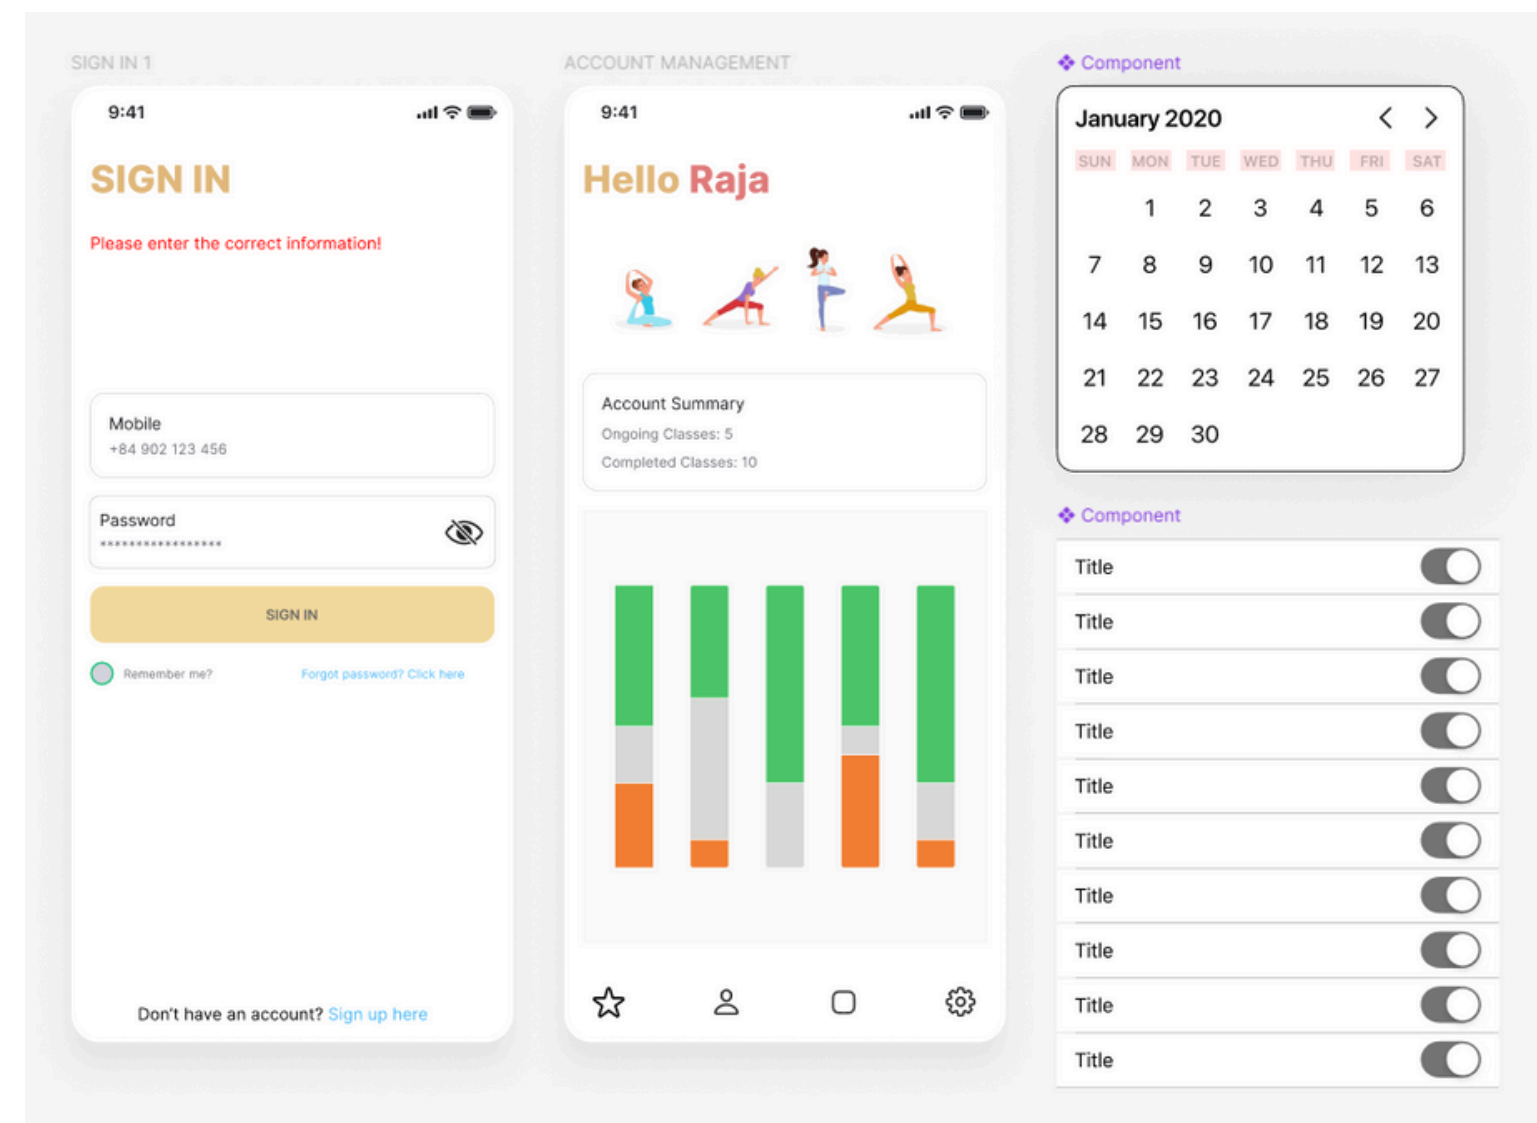

5. Sketches of Register, Sign in, Create new class function (See details [here](#))

I used **Balsamiq** to build wireframes those functions

6. Wireframing with Figma

I used **Figma** to build a few wireframes for previous sketches. It is important that a business analyst owns relevant skills in designing and Figma is one of the most popular tools at the moment.

7. Use Case Diagram (See details [here](#))

Use Case Diagram is used to demonstrated the interaction between user and system / business environment

Here are a few tasks included in this project:

1. Draw Use Case diagrams for each functional module of Yostructor
2. Write Use Case specifications for the Register and Create New Class

Please click [here](#) to see detailed Use Case Diagrams

8. Use Case Specification

User case specification include the following parts:

- Use case ID
- Use case name
- Description & Actor(s)
- Priority Trigger
- Pre-Condition(s)
- Basic Flow
- Alternative Flow
- Exception Flow
- Business Rules
- Non-Functional Requirement

Please click [here](#) to see detailed Use Case Specification

THANK YOU
VERY MUCH
